# STANDING SEAM OIL CANNING WAIVER

Oil canning can originate with stress in the metal coil from which the metal panel is milled. It can occur during fabrication or on installation. It may show up as a symptom of a bigger problem with the substructure. Oil canning is an inherent characteristic of light gauge, cold-formed metal products, particularly those with broad, flat areas.

Oil canning is an aesthetic problem. Normally structural integrity is not affected. We cannot realistically guarantee the total elimination of oil canning. Because of this factor, oil canning is **not** grounds for panel rejection.

To help eliminate oil canning, we recommend adding striations to the flat part of the panel and/or using “backer rod” (a foam product attached to the back side of the panel).

***Waiver of liability:***

I/we certify that I/we have read and acknowledged the foregoing information and I/we recognize the inherent risks of oil canning for these panels. I/we release Premier Metals, LLC from any and all liability related to the appearance of oil canning. I/we assume full responsibility and/or liability for how these panels are ordered and installed, and for any future oil canning claims.
